

Refining the Rail Grinding Strategy to Improve Surface Conditions and Reduce Defects on CSX

DALLAS, TX

Dan Hampton CSX

- Director of Contract Services
 - rail grinding
 - shoulder ballast cleaning
 - ballast distribution systems
 - ditching
 - undercutting
 - yard cleaning
 - vegetation management
- BS in Systems Engineering - West Point
 - Army Field Artillery School
 - Army Ranger School
- He is a member of AREMA
Subcommittee 9 in Committee 4 – Rail.

Rail Grinding is Optimization

94% Reduction in SSC / SDZ 2015 – 2025			70% Reduction in TDD/TDC/TDT 2015 – 2025		
83% Reduction 2015 – 2020 (Specialty Assets, Bridges, Curves)			26% Reduction 2015 – 2020 (Frequency & On Time)		
62% Reduction 2021 – 2025 (Switch Points, RGT, Preventive)			60% Reduction 2021 – 2025 (Target Gauge Corner RCF)		

Technology and Process Improvements					
1	Dan Hampton Takes Over Grinding Program			6	Planned Preventive Grinding (PPG) Crack Growth Schedule Grind
2	Mount Carbon Derailment – SSC masking a VSH			7	CSX Schedule Routing Software to Optimize Routing & General Depth of Cut Increase Led to Reduction in Track Miles
3	Combined RG400 & RGS Operations Increased depth of cut for all surface conditions			8	Increased Grinding Specifications of Gauge Corner Depth of Cut and Sensitivity of the Curve to Worst Case Conditions, Bridge RGS Program
4	Tonnage-Based Grind Cycles and Inspection-Based Grind Planning (Auto Skip tangents based on profile & surface conditions, and MGT since last grind)			9	Target Rail Conditions with RGS/RGT (Switch Point Patterns, Mid-Cycle Grind)
5	Bridge Grinding Policy based on substructure, SSC GPS Targeting Software			10	Implement New Optimized Target Profiles, Pattern Creation & More

CSX SSC & SDZ Total Lengths by Cause per year

Optimizing Scheduling

2015-2025 Update to Demand-Based Scheduling

- Tonnage-Based Grind Cycles
- Planned Preventive Grinding (PPG) Damage Model
- CSX Schedule Routing Software to Optimize Routing
- Trade-Off of Grind Speed/Productivity vs. Depth of Cut

2026 – Updates to Condition-Based Scheduling

- Adding Grind History and Quality Inputs to Prioritize

94%+
Network Compliance
Before
MGT Target

98% Arrival Compliance with 1.4h Additional Track Hours

Arrival	Track Distance % of Total	Arrival	Track Distance % of Total
Early	607 51%	Early	1,697 72%
On Time	205 17%	On Time	616 26%
Late	375 32%	Late	51 2%

- Cycle 1

- Cycle 2 when Cycle 1 *without* Specialty Grinder

- Cycle 2 when Cycle 1 *with* Specialty Grinder

 - RailPro & NavPro (Execution)
 - PAMS (Scheduling)
 - Digital Twin (Rail Life & Economics)
 - Ballast cleaning optimization (RailDoctor)
 - Tie Capital Planning (Aurora)
- HBA in Business Admin - Western
- ICRI VTI Economics Group

Vertical Split Head (VSH) Defects

- CSX has focused on preventing vertical split head defects (VSH) after 4+ broken rails in 2025. High risk

- Vertical Split Head (VSH) means a vertical split through or near the middle of the rail head
- A shear break is a longitudinal separation of the rail head, resulting from the loss of significant rail head parent metal and is not typically associated with inherent conditions in the material.
- A shear break usually occurs when the rail is loaded off the center axis, and can be associated with gaging problems, light weight rail, severely worn rail, or off-center loads caused by worn rolling stock wheels

FRA - Track Inspector Rail Defect Reference Manual - July 2015

Key Learnings

Optimization

- End of life field data alone takes decades to establish feedback loop and inability to isolate individual improvements
- Compare many different options to better understand the trade-offs of rail life, productivity, and economics

Data-Driven at Scale

- When possible, evaluate as many potential locations as possible to get the best sense of the root cause of the problem
- GQI is quality metric to measure how close post-grind profile matches target profile, not whether the target is right

Implementation

- Ensure the implementation is possible and does not lead to unforeseen challenges
- All components need to be evaluated, Wear Life, RCF Risk, Targeted Metal Removal, Productivity

Continuous Improvement

- Use field testing and wear & defect data trends to build confidence in the models for leadership and auditors
- Monitor developments in real-time to make adjustments to the program quickly
